

Manual QA Testing Strategy – Hotel Booking App

1. Introduction

This document outlines the **manual QA testing strategy** for the *Hotel Booking* app, with a focus on verifying **critical user journeys**, **UI validations**, and **app state transitions** to ensure a high-quality user experience across supported platforms.

2. Testing Objectives

- Verify that **key user flows** behave as expected end-to-end.
 - Validate **UI components** against design and functional requirements.
 - Confirm that **app state transitions** correctly reflect user interactions.
 - Prioritize testing of **critical and high-risk features**.
 - Identify gaps in **automated test coverage** to guide future improvements.
-

3. Scope

Functional Areas:

- Overview screen
- Hotel search
- Hotel list and scroll behavior
- Favorite/unfavorite functionality

- Favorites list display
- User account screen

Platforms:

- Android (physical device/emulator)
- iOS (simulator/device)

Testing Types:

- Manual functional testing
- UI validation
- App state transition testing

4. Testing Approach

4.1 Key User Flows

- **Hotel Search and Clear:**
Input validation, result accuracy, handling of no-results, invalid or empty input, and clearing of previous searches.
- **Hotel Details & Listing:**
Display hotel cards with name, image, and favorite icon; test vertical scroll for smooth UX.
- **Favorites Flow:**
Add/remove favorites and validate persistent state across sessions and app restarts.
- **Navigation:**
Ensure seamless navigation between:
Overview → Hotels → Favorites → Account.

4.2 UI Validations

- Match design specifications: fonts, color palette, button sizes, icons, input fields.
- Responsive behavior on different screen sizes/resolutions.
- Validation for empty or whitespace-only inputs.
- **Accessibility:**
 - Verify correct **focus order**.
 - Ensure screen reader support via **semantic labels**.

4.3 App State Transitions

- **State changes:** idle → loading → success or error.
- **Network error handling:** retry mechanisms, timeout scenarios.
- **App lifecycle events:**
 - Background → foreground
 - App restarts
- **Edge cases:**
 - No internet connection (Wi-Fi or mobile)
 - Invalid endpoints or empty API responses

5. Test Data Preparation

Standard Test Data:

Category	Example
Hotel Name	Comfort Suites Ocean City West
Cities	Berlin, New York

Pincode	13581
Address	12718 Ocean Gateway, West Ocean City, Ocean City, MD 21842

Edge Case Data:

- Empty input: " "
- Whitespace-only: " "
- Long strings: 100+ characters
- Special characters: @#%^*!@()

Negative Test Data:

- Non-existent search terms: tzxt, !!invalid!!, 123abcxyz

6. Priority Test Cases

High-Priority Areas:

- Hotel search with valid, empty, and invalid inputs
- Favorite/unfavorite toggle and visual state change
- Display and correctness of the Favorites list

7. Reporting and Follow-Up

- Log all bugs with **reproducible steps** in a bug tracking tool (e.g., *Jira*).
- Include **screenshots/videos** for UI-related issues.

- Attach relevant **logs and environment details** (OS, device, app version).
- Collaborate with the development team for timely fixes.
- **Retest** resolved issues in subsequent test cycles.
- Recommend automation for repetitive and critical manual flows.
- Generate **automated test reports** for stakeholder visibility.
